Not all images that use Adobe Photoshop or similar editing software are necessarily for professional use. If you want to create a specific image as a souvenir, a customer gift or a political poster, you can certainly do that with Photoshop without having to edit it to another format such as JPG. For example, a picture of a wedding

reception or a baby picture can be edited in Photoshop then saved in a JPG format, so it can be read on other computers or on a cell phone. Editing digital images Photoshop enables you to edit images in three basic ways: Basic editing: In this method, you can manipulate individual layers in a single image without affecting the layers underneath it. This is useful to manipulate a single

element, such as the face or the eyes of a person, and not needlessly complicate it. Layer-based editing: When you create a new layer, you can apply edits to it without effecting any other layers, so the edit remains clearly visible. By contrast, if you edit only the original image, such as erasing the background or adding a layer, it's hard to tell what you did when you apply it to the original

image. Alpha compositing: With this method, you can combine two or more images on a layer so that the combined image retains the transparency of the original images. You can use this to overlay text, people, or other objects that might not display properly on their own if you simply apply the image you want to the background. Saving images Images can be saved in two formats:

Bitmap: Bitmaps are generally used to store raster images, such as photographs, or other graphics. Vector: Vector images are bitmaps that create more professional, detailed effects and look better when printed. Actions available for saving images The Export command enables you to save different files from the same or different images. The image you save may

look similar to the original, or it may be totally different. The following list shows Export options and what they do: Save as: Choose this option to save the image as a new file. Save as type: Choose this option to choose an existing type of file, such as JPEG or EPS. Save to: Choose this option to select a specific location to which to save the file. Specialty Tools are necessary to fill this order.UV curable coatings are applied in the fields of coating ceramics and coating paints. The UV curable coatings are applied in a manner of coating substrate, curing, peeling and recovering. In the end of the application process, the uncured UV curable coating is applied on a coating film, cured by UV irradiation, coated and

cured after the recovery thereof, and continuously operated on the coatings of the substrate. The resin that has cured after curing by the UV irradiation is insoluble and substantially non-toxic. The UV curable coating has advantages including, the uncured resin can be applied under the flowing condition, low-temperature curable, can be used as an inter-laminar adhesive, and can be used

at a low pressure. As a result, the coating can be applied to various substrates and is expected to be an excellent coating material. The UV curable coating may contain organic substances such as solvents. However, the addition of the organic substances for generating a large amount of heat by the use of a high-output UV irradiation may incur the problem of low curing

property at a low temperature, and the addition of a thermally unstable material may incur the problem of lowering the structural stability after coating and curing. The application of an inorganic material such as water glass and organic materials such as polyisocyanates is known as a method of resolving the above-mentioned problem. The organic materials, in

particular, are known as a method for resolving the problem, and an example of practical uses is known in JP-A-10-312651. JP-A-10-312651 suggests that a coating film is formed by applying a solvent dispersion containing (a) fluorine-containing resin and (b) at least one resin selected from a group consisting of a polyester-based resin, a polyurethane-based resin, an epoxy-

based resin, a polycarbonate resin, a polyim
